Blush-Tone Acid Stain Applied to Gray Concrete

Blush-Tone Acid Stain Applied to White Overlay

BRICKFORM Blush-Tone Acid Stain™

Chemical Stain For Concrete

BRICKFORM Blush-Tone Acid Stains color concrete surfaces with a beautiful, variegated and mottled appearance. Reacting with the minerals that exist in new or existing concrete, Acid Stain transforms ordinary concrete into the rich look of granite or marble. The effect is random depending on the composition of the concrete. Even more interesting shades and colors can be obtained by using Blush-Tone Acid Stain over integrally colored concrete, or over BRICKFORM Color Hardener and Antique Release Agent.

Coverage and Application: One gallon will cover 200 to 300 s.f. of concrete surface. Apply with a sprayer suitable for acid, or by paint brush working the stain from wet to dry to avoid drying marks. BRICKFORM Blush-Tone Acid Stain can be diluted with water to obtain lighter shades and extend coverage rate.

A second or third coat can be applied to darken color. Allow stain to dry between applications. More than three full-strength applications is not recommended.

Caution: Keep out of reach of children.

Disclaimer on Color Chart: The colors shown on this document BRICKFORM accepts no responsibility for color variations. An exact match will be obtained only by doing a jobsite sample. Please test first.
